CS3041 Aleksandr Samarin README.txt 04/25/2024

How to run website:
Provided in the submission are the html files, style.css, and all the
.jpg's needed for the a successful run.

To open the website. I ahve uploaded my files to a private Github
repository with the link:
https://github.com/asamarin22/projectXplor

Alternative way (recommended):
Download and extract the .html, .css, .jpg files to one file and open on
a desired IDE. I used Visual Studio Code to build the website.

When you have the extracted folder, open the index.html in the browser of
your choice. This should then allow you to navigate through the pages
freely.

State of the Hi-Fidelity prototype from this assignment:
      As it is the hi-fi prototype i decided to code the website to a
certain degree of completion. I included colors and fonts to match those
in my moodboard. I have also implemented some feature upgrades from the
last user evaluation.

      As for features and pages that have not been fully implemented:
            -Any settings or login page that I desired is non functional.
            -To save time on creating html pages, I created the design
for the addFlightInfo
                  This is because train, roadtrip, hotel, and other will
have similar pages to go to.
                  These pages will also eventually have the same result
once the form is submitted.
            -As of right now, the program only holds one trip on the
myTravelHub page
